Operation group: 204106				Head of clinic Dr S. GUSKA /signed/	
<input type="checkbox"/> Cured	<input type="checkbox"/> Recovered	<input type="checkbox"/> Not cured	<input type="checkbox"/> Examined	<input type="checkbox"/> Died	<input type="checkbox"/> Transferred to:
<p>CASE HISTORY: Transferred from the Dobrinja hospital because of a pneumothorax on the left side, which occurred after a gunshot wound to the left side of the thorax. In addition to this wound there are several wounds to the left upper arm, right lower arm, left upper leg and dorsal side of the left foot. When he was received, the pneumothorax was confirmed clinically, physically and by X-ray, and the left pleural cavity was drained, which /?gave out/ air. The pleural drain was removed on the sixth day after the drainage was carried out and a stable re-expansion of the left lung has been achieved. On the third day after reception, primary stitches were put on wounds in other areas. Antibiotics and analgesics were administered at reception. Lung X-rays showed the presence a foreign metal object /illegible/ to the left, the size of a small grain of rice.</p> <p>Discharged for treatment at home with the recommendation that the pin and thread from the location of the pleural drainage be removed after two days, and the primary stitches after five days. Administer analgesics as necessary and practice deep breathing. Check-up at this clinic as needed.</p> <p style="text-align: right;">Dr S. GUSKA /signed/</p> <p>Head of department: _____ Duty doctor: _____</p>

Grupa operacija: 204106		Predsjednik Poslovnog odbora - direktor dr S. Gusić			
Izliječen	Oporavljen	Neizliječen	Ispitan	Umro	Premješten na:

EPICRISIS: Upućen iz bolnice na Dobričaji zbog lijevostranog pneumotoraksa koji je nastao nakon sklopotarske rane lijevog hemitoraksa. Uz navedenu povredu više rana u području lijeve nadlaktice, u području desne podlaktice, u području lijeve natkoljenice i dorsalne strane lijevog stepala. Pri prijemu klinički, fizičke i radiološki potvrđen lijevostrani pneumotoraks te se učini drenazna lijevog pleuralnog kavana pri kojoj se dobije srak. Pleuralni dren odstranjen šestog dana po učinjenoj drenazi a po postizanju stabilne reekspenzije lijevog pluća. Treći dan po prijemu učinjeni primarni odležni ševovi rane u ostalim regijama. Pri prijemu ordinirani antibiotici, analgetici. Na preglednim snimcima pluća uočava se prisustvo metalnog stranog tijela parahilarnu lijeve, veličine manjeg srak ruke. Otpušten se na kućnu njegu sa preporukom da se sa 2 dana skine kopča i košica sa sjestopleuralnodreznice, a primarni odležni ševovi sa 5 dana. Ordinirati analgetike po potrebi, vježbe dubokog disanja, kontrola na ovoj klinici po potrebi.

dr S. Gusić
